

RUMITECH SOLUTIONS FLAGSHIP PLATFORM

RTS FEEDLOT

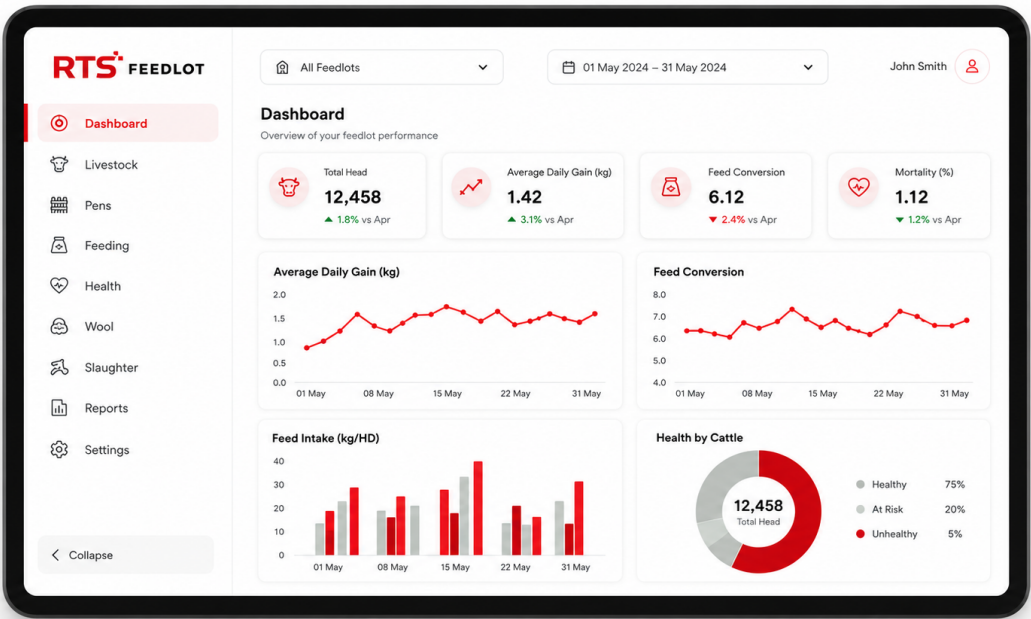

From daily records to better decisions.

RTS Feedlot is a practical, data-driven management platform designed to connect livestock, feed, health, wool, slaughter results and profitability in one system.

See the operation clearly.

RTS Feedlot brings day-to-day records into a single management view, so information captured on farm becomes useful operational and financial insight.

01

Livestock & pens

Track animals, groups, pens, movements and current head counts in one place.

02

Feed & intake

Link rations, feeding records and feed use to the animals and pens consuming them.

03

Health & treatments

Record treatments, processing, mortality information and health events with better traceability.

04

Wool & slaughter

Connect production outcomes such as wool and slaughter information back to the livestock records.

05

Costs & profitability

Bring operating data and costs together to improve visibility of performance and margin.

06

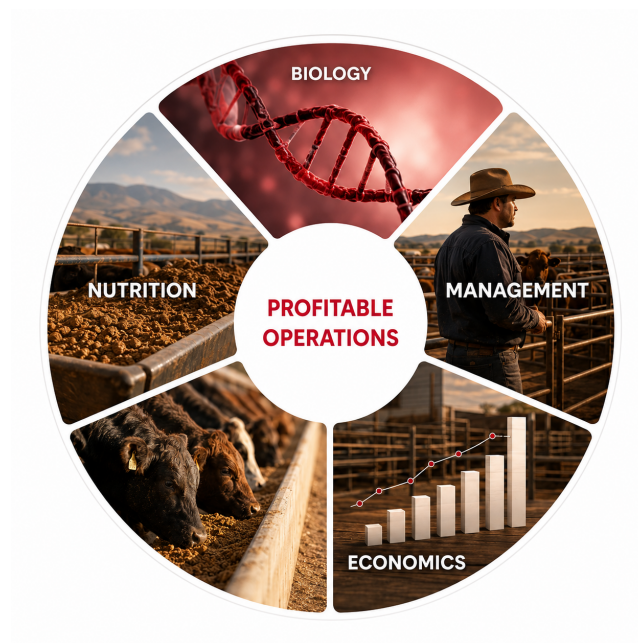

Reports & insights

Turn daily records into management reports that help identify trends, problems and opportunities faster.

The numbers only matter when they improve decisions.

Good feedlot performance depends on more than one number. RTS Feedlot is designed around the interaction between animals, nutrition, management systems and economics.

- ✓ **Daily visibility:**
Capture what happens while it is happening, not weeks later.
- ✓ **Traceability:**
Connect events and outcomes to the correct livestock, pen or management group.
- ✓ **Consistency:**
Create repeatable workflows for staff and management.
- ✓ **Accountability:**
Compare actual use, treatments and performance with the plan.
- ✓ **Commercial focus:**
Keep performance and profitability visible in the same system.

A system that grows with the way you manage.

RTS Feedlot is designed as a practical management platform rather than a static reporting tool. Modules can support the areas that matter to your operation while keeping the core livestock, feeding and profitability structure connected.

Management teams

Give managers a clearer operational picture without relying on disconnected spreadsheets and paper records.

Feed teams

Capture feeding information close to the point of work and create better visibility of feed use.

Animal-health teams

Keep treatment and mortality information connected to the livestock record and management group.

Owners & decision makers

Access meaningful performance and profitability information from the same operational data source.

Export-focused operations

Support stronger records and compliance workflows where export requirements form part of the business.

Growing operations

Use optional functions where required while keeping the essential management structure intact.
